Mediation of the effects of deficiency of calcium and magnesium on cadmium toxicity by altered membrane structure and function. The purpose of this study was to investigate the effect of trace element deficiencies (deficiency of calcium and magnesium) on cadmium toxicity. Previous investigations had shown that both calcium and magnesium deficiencies increased cadmium toxicity. The majority of available information suggests that the effect of trace element deficiencies is dependent on complex interactions between the trace elements and ion-transport systems in the plasma membranes and the cell membranes. The investigation of these ion-transport systems revealed that both calcium and magnesium deficiencies increased the cadmium-induced changes in the membrane's structure and function. The increase in the density of lipid microviscosities with cadmium toxicity was greater for magnesium-deficient than for calcium-deficient rats. However, the cytosolic free calcium concentration was enhanced only by the calcium-deficient diet and not by the magnesium-deficient diet. The increased cadmium accumulation in calcium-deficient animals was associated with a significant decrease in brush border membrane-associated calcium-binding protein, whereas the cadmium accumulation was not altered in magnesium-deficient animals. Cadmium accumulation was not reduced in either the magnesium-deficient or the calcium-deficient animals. The results suggested that the structural and functional changes in the membranes have a minor
