1. Field of the Invention The present invention relates to a gate driver circuit for driving a gate of a power device.

2. Description of the Related Art Heretofore, in a semiconductor device, a gate driver circuit for driving a gate of a power device has been provided with a circuit such as that shown in FIG. 7.

The circuit is arranged to constantly maintain a gate current $i_{\text{sub.G}}$ of the power device at a desired level by changing a pulse width of a pulse signal $i_{\text{sub.SG}}$ in response to a change in gate voltage of the power device. The gate current $i_{\text{sub.G}}$ is fed to a gate of the power device and is connected to an output terminal Out. In FIG. 7, the power device is a power MOSFET (Metal Oxide Semiconductor Field Effect Transistor). A gate driver circuit shown in FIG. 7 is known as that of a power MOSFET that has the highest current density. It is arranged to maintain the gate current $i_{\text{sub.G}}$ of the power MOSFET at a predetermined level by changing the pulse width of a pulse signal $i_{\text{sub.SG}}$ that is applied from the gate driver circuit to a gate electrode of the power MOSFET in response to the gate voltage of the power MOSFET. A base current B of the power MOSFET is generated by supplying the pulse signal $i_{\text{sub.SG}}$ having the preset pulse width to the gate electrode of the power MOSFET. In such a gate driver circuit, when a power-on reset (POR) signal is outputted, the power MOSFET is cut off from a

power supply circuit, and the gate current $i_{sub.G}$ of the power MOSFET is cut off. When the POR signal is reset, the power MOSFET is turned on. In such a case, the base current B of the power MOSFET is generally held by a holding circuit or the like. In the circuit of FIG
