As great as Adobe's Photoshop is, I do have some gripes with it. There were a couple of times when I encountered problems that made me question its overall reliability. One instance was while I was editing my work on my iPad, and a drain spout that was in a low-light backlit situation would leak bright light onto the camera. This was easily fixed by loading the image into Photoshop and turning it into an RGB, which is the optimal image format for digital photography. Then I connected the iPhone through iTunes to my Mac and synced the image into the phone. I ran into a problem when I tried to import the image from the phone as a new document into Photoshop. As soon as I selected the iPhone's image from the linked library, the message saying that the image (*cannot be loaded*) popped up. After checking the "Options" list in the upper menu, I found out that the image was first being loaded as a JPEG. As such, I had to either use Image -> Convert to JPEG, or choose RAW mode, which would have required a ton of cropping. Thankfully, the problem was fixed by using the "RAW Files" as the destination, which loaded the image into a new index entry. Another time I ran into problems was when I ran a successful stack on the background. However, most of the images were over-exposed, or a portion of the back was too bright. In the latter case, I cut out the part that went over-exposed, and then dragged the back into place with the "Move" tool.
