Category:Metallurgy Category:Standards of Germany Evaluation of standard therapy using leukapheresis for acute coronary syndromes. This study evaluated leukapheresis (LA) in acute coronary syndromes (ACS) inpatients after successful standard treatment. We performed a retrospective study of ACS inpatients who underwent LA at our center between December 2004 and June 2009. Patients who underwent LA because of standard therapy failure were included in this study. Patients were divided into three groups according to therapy: group 1, patients receiving only standard therapy; group 2, LA on standard therapy; and group 3, patients receiving LA on standard therapy in combination with mechanical reperfusion and dual antiplatelet therapy. The primary end-point was major adverse cardiac events (MACE) consisting of cardiovascular death, myocardial infarction and cerebrovascular accident. Sixty-three of 320 ACS patients in hospital were treated with LA. The primary end-point was achieved in 57 of 63 (91.9%) patients in group 1, 14 of 31 (45.2%) patients in group 2, and 9 of 15 (60.0%) patients in group 3. The Kaplan-Meier survival curve indicated that the cumulative rate of MACE within 5 years was not different among the three groups (log-rank test,  $p = 0.213$ ). Cox regression analysis indicated that LA on standard therapy (group 2) was an independent predictor for early and late MACE (hazard ratio [HR] 2.244, 95% confidence interval [CI] 1.053-4.765, and HR 3.094, 95% CI 1.541-6.280, respectively). LA on standard therapy can effectively reduce MACE in a small number of acute coronary syndrome patients.
