First, you will need to locate Adobe's website and access the files for your version of the software. Once the files are displayed, you will need to download the repair tool. After the repair tool is downloaded, you will need to open it and follow the instructions on the screen. After this, you can use the repair tool to fix any problems that you are having. For instance, you may not be able to open it because it is not opening. If this happens, you'll need to launch the repair tool and then follow the instructions to repair it. After the repair is complete, you can close the repair tool and use Adobe Photoshop normally.

What is really worth mentioning is that the new "Create Version History" function creates versions of your files enabling you to see the changes over time -- you can understand and even correct them. After the upgrade I tried to create a new file, called "New.jpg" and closed Lightroom. When I opened it after some days - due to file sync and some cloud storage problems - I thought it couldn't be opened and I had to recheck everything. The files were there - it was just a problem in the back-end that it was looking for the file "New.jpg." I was able to restore them in the original state. As for the image import process, which anyone will know is a pain, I can't say the new version goes any further than the previous one. It is however, worth saying that the whole "one component per image" workflow is just not possible. It doesn't mean that you can't manage your images any other way. In fact, there are enough options available to be able to manually import from several sources (Camera Raw, Raw Developer, Camera Raw Photoshop Plug-ins like 360 and Credo, Lightroom Extensions or even Disk Fireworks). Perhaps a new plug-in or two can fill the gap in the workflow I had before (Lightroom can't import anything from Camera Raw and Raw Developer). I can also say that if you are like me and import a raw image from a photo magnet into Photoshop, and then open the imported file, you can then change the size in Bridge or Camera Raw so it matches the physical size of the photo magnet file -- which is often smaller (in terms of file size) than the actual physical photo when the wizard in Bridge or Camera Raw is working on converting it to "positive" JPG. This is a real flagrant oversight in the version 4 release, due to the switch to 8-bits-per-channel alpha. And the switch to 16-bits-per-channel color. My guess is that the new Camera Raw 4.2 plug-in is designed to repair that. I would have preferred a change that would have just enabled Photoshop to import the file without changing the settings on either Bridge or Camera Raw. This would have kept you to using the raw files in Bridge or raw developers. Also, Lab Channels don't work, which was a quite important feature. And software rendering is now enabled. This all means you can't do any batch processing in Photoshop any more (often I import a list of images into Bridge, put them in Reverse chronological order, Crop them, duplicate them, Filter then export to my removable hard drive. These steps are repeated for several locations in my archives). There is no way to batch export JPG's from Photoshop CS6. You really have to export it to a separate application (eg, Lightroom). Regardless, there are plenty of reasons for switching between Bridge, Raw Developer and Photoshop. Seems to me, they would have included an easier way to switch between them in Camera Raw 4.2. Lightroom can do so, why can't Photoshop? Or is it just going to be blind faith from now on that Photoshop can only import/export to/from the proprietary Memory Stick format? Another change in 4.2 is not any change you will usually notice. The background of the input controls in Camera Raw preview dialog stays white for a long time after you close the dialog. Some long wait for the preview to close.

Adobe Photoshop is one of the top photo editing and photo enhancing software products on the market. It has a lot to offer from its basic photo editing features, such as creating balance layers for creating natural looking photo editing adjustments, to its more advanced features for retouching and enhancing your images. Adobe is a company that tries to put its users first, and it's this fact that sets it apart from other image editing software manufacturers.
